EDUCATION

Ateneo de Manila University

Expected May 2028

Bachelor's of Science in Computer Science

EXPERIENCE

R&D Data Scientist

June 2026 – Present

Quartz Labs - London, United Kingdom

- Built the quality-control layer for a social-listening product that spots emerging consumer trends, filtering **86k** social posts and **17k** detected trends across **5** platforms down to the ones worth acting on
- Designed a testing framework that measured how well each filter predicted what actually happened next, proving the strongest one identified trends that went on to grow **1.65x** faster, validated across 2 clients
- Diagnosed and fixed a data-collection imbalance that was hiding real trends, increasing the volume of validated results by **6x**, and audited platform billing to prevent a **\$2,100** overspend

Software Engineer Intern

July 2026 – Present

Swarm - Makati, Philippines

- Built a compliance knowledge graph across **7 frameworks** and **2,711 requirements**, each traceable to a byte offset in a hashed source
- Cut equivalence scoring from **3.4M** candidate pairs to **6,406** using graph community detection, an infeasible step reduced to one hour
- Produced **2,182 typed cross-framework links** with confidence and rationale, surfacing **87** relevant requirements where keyword search found **15**

Web Development Deputy

Dec 2025 – April 2026

TEDxAteneoDeManilaU - Manila, Philippines

- Designed and developed an intuitive, theme-driven website that clearly communicated the event's purpose and talk concepts through engaging visuals and smooth interactions
- Improved user experience by organizing content so that **90% of essential event** information was accessible within the first section of the site
- Reduced friction in the registration process by simplifying form flows and navigation, decreasing the registration process to **3 clicks**

PROJECTS

S1napse

Nov 2025 - May 2026

Personal Project

- Designed a unified reader abstraction over 6 vehicle data sources, integrating 5 real-time sim telemetry protocols (shared memory, UDP) and ELM327/OBD-II to stream and normalize 40+ channels at 60 Hz.
- Built a real-time analytics layer (math channel engine with custom formula parser, corner detector, trail-brake analyzer) producing sub-second coaching insights, shipped to users as a signed Windows installer with auto-update.

entroscope

May 2026

Personal Project; 1.3k downloads on PyPI

- Published an open-source entropy toolkit for time-series analysis, implementing 7 information-theoretic measures (Shannon, permutation, sample, approximate, spectral, differential, multiscale) behind one consistent `compute/rolling/delta` API over pandas and numpy.
- Extracted the library from a trend-detection project where falling Shannon entropy of regional search interest served as an early signal, and hardened it with 14 test suites, CI, and headless-safe plotting.

bigfiles

May 2026

Personal Project; 136 downloads, 8 stars on crates.io

- Built a parallel disk scanner in Rust on the `ignore` walker with a 4-stage dupe pipeline (size → inode → partial/full BLAKE3) and a persistent hash cache, taking warm re-scans from 0.45s to 0.011s.
- Shipped a 4-subcommand CLI and a `ratatui` TUI with filter, trash-by-default delete, and dupes-for-subtree, distributed as prebuilt Linux/macOS/Windows binaries.

SKILLS

Languages and Frameworks: JavaScript (ES6+), TypeScript, Python, Java, Rust

Libraries and Tools: React, Next.js, Node.js, PostgreSQL, Drizzle ORM, Neon, Supabase, TailwindCSS, OpenAI/LLMs, Git, Vercel, Cloudflare, Excel, Powerpoint
