EDUCATION

Ateneo de Manila University

Expected May 2028

Bachelor's of Science in Computer Science

EXPERIENCE

R&D Data Scientist

June 2026 – Present

Quartz Labs - London, United Kingdom

- Built the confirmation layer for a social-listening trend engine, replacing fixed % growth thresholds with a per-entity permutation test that validates each candidate against its own historical noise, and verified it end-to-end on **2,200** live-scraped posts
- Added a **Shannon-entropy** source-diversity check that suppressed single-account false positives after diagnosing from the codebase that author-diversity data was stored but never used in promotion decisions
- Integrated a **5-platform** scraping pipeline across TikTok, Reddit, X, Instagram, and Google Trends, debugged live actor failures, and **cut scrape cost 65%** by profiling per-platform spend
- Ran the gate on real data where it confirmed a genuine rising trend and held flat, low-signal entities, isolating data density as the true constraint rather than the model

Full-Stack Developer

May 2025 – May 2026

One Big Match - Manila, Philippines

- Led and supervised a team of **3 developers** and designers, managing task distribution, timelines, and project milestones
- Architected and implemented full stack solutions across **front-end and back-end systems** to ensure scalability and performance
- Collaborated with a **7-person marketing team** to align technical implementation with branding strategy, user engagement goals, and product launch timelines

Web Development Deputy

Dec 2025 – April 2026

TEDxAteneoDeManilaU - Manila, Philippines

- Designed and developed an intuitive, theme-driven website that clearly communicated the event's purpose and talk concepts through engaging visuals and smooth interactions
- Improved user experience by organizing content so that **90% of essential event** information was accessible within the first section of the site
- Reduced friction in the registration process by simplifying form flows and navigation, decreasing the registration process to **3 clicks**

PROJECTS

S1napse

Nov 2025 - May 2026

Personal Project

- Designed a unified reader abstraction over 6 vehicle data sources, integrating 5 real-time sim telemetry protocols (shared memory, UDP) and ELM327/OBD-II to stream and normalize 40+ channels at 60 Hz.
- Built a real-time analytics layer (math channel engine with custom formula parser, corner detector, trail-brake analyzer) producing sub-second coaching insights, shipped to users as a signed Windows installer with auto-update.

entroscope

May 2026

Personal Project; 1.3k downloads on PyPI

- Published an open-source entropy toolkit for time-series analysis, implementing 7 information-theoretic measures (Shannon, permutation, sample, approximate, spectral, differential, multiscale) behind one consistent **compute/rolling/delta** API over pandas and numpy.
- Extracted the library from a trend-detection project where falling Shannon entropy of regional search interest served as an early signal, and hardened it with 14 test suites, CI, and headless-safe plotting.

bigfiles

May 2026

Personal Project; 136 downloads, 8 stars on crates.io

- Built a parallel disk scanner in Rust on the **ignore** walker with a 4-stage dupe pipeline (size → inode → partial/full BLAKE3) and a persistent hash cache, taking warm re-scans from 0.45s to 0.011s.
- Shipped a 4-subcommand CLI and a **ratatui** TUI with filter, trash-by-default delete, and dupes-for-subtree, distributed as prebuilt Linux/macOS/Windows binaries.

SKILLS

Languages and Frameworks: JavaScript (ES6+), TypeScript, Python, Java, Rust

Libraries and Tools: React, Next.js, Node.js, PostgreSQL, Drizzle ORM, Neon, Supabase, TailwindCSS, OpenAI/LLMs, Git, Vercel, Cloudflare
